

DEMO DAY · 21 SEPTEMBER 2026

The demo, word for word

One purchase, start to finish. Every click, in order, and what to say while you click it. Forty steps, about fifteen minutes.

Vertex ERP — Enterprise Resource Planning
and Workflow Management System

Shahjalal Islami Bank PLC — Common Services Division

What you are actually showing them

The bank needs 12 laptops. Around ₹ 14 lakh. That is too much money for someone to just go and buy, so by law they must let several companies compete for the work. That competition is a **tender**. Each company sends in an offer. An offer is a **bid**.

Why every bid comes in two sealed envelopes

The oldest trick in procurement: somebody inside looks at the prices first, sees that his friend's company is expensive, and then invents a technical reason to knock out the cheaper ones. He picks the winner, then writes the justification backwards.

So each bidder sends **two separate sealed envelopes**. **Envelope 1 — Technical:** what am I selling you, what warranty, proof I am a real Dell dealer. No price anywhere. **Envelope 2 — Financial:** the price, and nothing else.

The bank opens **only the technical envelopes** first, judges every bidder on quality alone, and writes the decision down. Only then does anyone open the prices. Nobody can work backwards, because the order is locked.

The story you are telling

Three companies bid: **Rahim Traders, Meghna Technologies** and **Bengal Office Solutions**.

Bengal is the cheapest — ₹ 13,20,000. But Bengal did not enclose the authorised Dell distributor certificate, and offers one year carry-in warranty instead of three years onsite. For counter equipment in a bank, that fails.

So Bengal is thrown out **before anybody knows they were cheapest**. The winner is Rahim Traders at ₹ 13,86,000 — ₹ 66,000 more expensive. And the system can prove, with timestamps, that the rejection happened before any price was visible.

That single fact is the demo. Everything else is scaffolding around it.

READ THIS FIRST

The five people

WHO

WHAT THEY DO IN THE STORY

Rezaul Karim	Officer, Gulshan Branch. Asks for the laptops. Approves nothing.
Farhana Akter	Department Head. First approval. Also sits on the evaluation committee.
Shahidul Islam	Procurement. Runs the tender, writes the work order, receives the goods.
Tanvir Ahmed	Chairs the evaluation committee. Opens the envelopes, picks the winner.
Nasrin Sultana	Finance. Enters the bill.

Plus **Mizanur Rahman** for the second approval, and **Kamrun Nahar** & **Golam Mostafa** for the payment sign-off if you have time.

Before you walk in

```
npm run reset    # clean slate, about 5 seconds
npm run demo     # builds and serves on localhost:3000
npm run warm     # pre-loads every page so none of them stalls
```

Then turn the wi-fi off. Nothing here needs it, and switching it off in front of them removes the venue's internet as a risk — and makes the point for you.

- Laptop on mains power. Screen sleep off. Notifications off.
- Browser at 100% zoom, one window, no other tabs.
- Every password is **Demo@2026**.
- **Switch user** is in the top bar. It moves between people without retyping anything.
- Sign in as **rezaul.karim@sjiblb.com** and leave the dashboard on screen.

PART ONE

Somebody asks for something

- 1 You are already signed in as **Rezaul Karim**. Do not click anything yet. Point at the sidebar.

SAY "This is Rezaul. An officer at Gulshan Branch. He is the bottom of the ladder, and he is where every purchase in this bank actually starts."

Bottom left of the sidebar reads **7 of 27 areas visible to Requisition Initiator**. Point at it.

- 2 Say what he **cannot see**.

SAY "No approvals. No tenders. No finance. Nothing about money. The system already knows who he is, and it shows him his own work and nothing else."

- 3 Click **Requisitions** → **New requisition**

A requisition is just a request to buy something. Say that out loud once, early.

- 4 In **Title type**: **Laptop replacement for branch operations staff**

- 5 In the item search box type **laptop**. Click **Dell Latitude 5450** in the dropdown. A green panel opens.

SAY "He has not typed a number yet, and it has already told him: three in stock, reorder level ten, and the bank last paid one lakh eighteen thousand five hundred each, in June."

- 6 Set **Quantity** to **15**. Watch the small line that appears beside the button.

SAY "He asked for fifteen. It found three already sitting in the store. So only twelve get bought. The bank does not buy what it already owns."

The line reads **3 from store, 12 to purchase**. That number 12 comes back twice more later.

- 7 Click **Add line**. Scroll down, paste a justification, click **Submit for approval**

You land on **REQ/CSD/2026/0847**, total ₹ **17,77,500**.

He tries to approve it himself

8

Still as Rezaul, on his own requisition, press **Attempt approval**

SAY “Rezaul wants his laptops. So he tries to approve his own request.”

The screen goes red and refuses. “You raised this document, so you cannot approve it.”

9

Press **Why was this blocked?**

SAY “This is not a rule in a manual that somebody can decide to ignore. That refusal happened inside the database transaction that would have made the change. There is no way around it — not for him, not for me, not for your system administrator.”

Now stop talking. Let them look at it. This is the first of the five moments and it is the one that tells them you understood the brief.

Do not rush past this

Every bank in the room has been sold a system that says “maker-checker” in the brochure and then lets a branch manager approve his own indent because the button was there.

Three seconds of silence here is worth more than three minutes of features.

Then approve it properly

10

Switch user in the top bar → **Farhana Akter**. Point at her sidebar.

SAY “Farhana is his department head. Look at her sidebar — it is bigger than his. Same system, different person, different bank.”

11

My Approvals → press **Review & approve** on the 0847 row.

12

Look at the approval chain on the right. Step three is greyed out.

SAY “It routed itself through two levels because of the amount. A bigger request would go all the way to the Managing Director. And notice — it does not just skip him quietly. It tells you why.”

It reads: *Not required — value does not exceed the ₳ 20,00,000 threshold.*

13

Press **Approve. Then **Switch user** → **Mizanur Rahman** → **Approve****

SAY “Two people, two levels, and neither of them is the man who asked for it. Now it is approved.”

Now it goes out to tender

Say this before you click anything

“Approved does not mean bought. Fourteen lakh is too much to just go and spend, so it has to go out to competition. Several companies get told what we need, and each one sends in a sealed offer.”

“What I am about to open is the same kind of purchase, already a few weeks further along, so you can see the whole of it rather than the first step.”

14

Switch user → **Shahidul Islam**. Click **Tenders**. Open **TND/SJIBL/2026/112**.

SAY “Published eleven days ago. Closed yesterday. Three companies bid.”

Keep this fast. It is setup, not a highlight.

15

Optional, sixty seconds. New browser tab → **localhost:3000/vendor/login**
→ **sign in as** **bids@rahimtraders.com.bd**

SAY “This is what the supplier sees. Different look, different login, completely separate. A bidder cannot see who else has bid, how many have bid, or what anybody offered. They are not users of your bank — they are outside it.”

Cut this first if you are short of time. Close the tab and go back.

What happens next, in one sentence

Three bids are sitting in that tender. Each one is two sealed envelopes — **what they are selling**, and **what it costs**. The next four pages are the bank opening them in the right order, and the system refusing to let it happen in the wrong order.

You try to look at the prices

16

Switch user → **Tanvir Ahmed**. Open **TND/SJIBL/2026/112** → **Bids** tab.

SAY “Tanvir chairs the evaluation committee. Three bids. Look at each one — two boxes, one on top of the other.”

17

Point at the lower box on each bid. It is gold, cross-hatched, with a padlock, and shows ♣ ■■,■■,■■■

SAY “That is the price envelope. It is still sealed. There is an envelope reference next to it so you can prove later that nobody swapped it.”

18

Press **Open financial envelope**

Refused. “Financial offers for this tender are sealed.”

19

Press **Why was this blocked?**

SAY “Nobody can see those prices yet. Not me. Not the committee. Not your system administrator. And this is the part that matters — the amount is not fetched from the database and hidden on the screen. It is never fetched at all. The only piece of code in this system that can read a price refuses to run until technical evaluation is signed off.”

The panel names the **data access layer** and quotes **clause 1.9** of their own tender document back at them.

This is the control a bank cares about most

Let it sit. If you say one more sentence after “until technical evaluation is signed off,” you will talk them out of being impressed.

If somebody asks “what if the administrator changes it in the database?” — good, that is the right question, and you answer it on the audit trail screen at the end. Tell them you will come back to it. Then actually come back to it.

Judge them on quality, then look

- 20 Go to the **Evaluation** tab. Press **Open technical envelope** on all three bids.

SAY “So we open the other envelope instead. Not the price — what they are actually selling us.”

- 21 Scroll to **Bengal Office Solutions**. There is a checklist. One line is red.

SAY “Bengal did not enclose the authorised Dell distributor certificate. They sent a letter promising they would source them through a reseller. And they offer one year carry-in warranty instead of three years onsite. These machines sit on cash counters. That fails.”

The red line reads **Authorised distributor certificate from the manufacturer — NOT SUBMITTED**. The checklist is built from what each bidder actually attached, not typed in by hand.

- 22 Before you decide, point at the whole screen.

SAY “There is no price anywhere on this page. Not hidden, not greyed out — not here. So this decision cannot possibly be influenced by what anybody asked for.”

- 23 Press **Qualify** on Rahim Traders. **Qualify** on Meghna. **Disqualify** on Bengal.

You can leave the score and comment boxes empty — sensible defaults fill in. Type into them only if you want to.

- 24 Press the gold button: **Complete and unseal financials**

SAY “The committee has now signed off its findings. That is what lifts the seal — and it cannot be undone.”

- 25 Go back to the **Bids** tab. The gold boxes are open. Read the three numbers out.

Rahim ₹ 13,86,000 · Meghna ₹ 14,04,000 · Bengal ₹ 13,20,000

Now say this, slowly

“The company we just threw out was the cheapest. And we did not know that when we threw them out. That is what the two envelopes are for.”

If you only land one sentence all day, land this one. Pause after it.

Put it on paper and pick the winner

26

Go to the **Overview** tab and press **Generate comparative statement**

SAY “This is the document your purchase committee actually signs. It ranks only the bidders who passed on quality.”

It opens on bank letterhead with a signature block. It is the paperwork the file needs, produced by the system rather than retyped by a junior.

27

Read the recommendation paragraph out loud.

SAY “And it says so in writing — that a cheaper offer existed, that it was rejected before any price was visible, and that under clause 1.10 of your own tender rules the bank is not obliged to accept the lowest offer. That is the paragraph your auditor wants and never gets.”

28

Optional. On Bengal's red row, press **Attempt award**

SAY “And just in case somebody tries anyway.”

Refused. A disqualified bidder cannot be awarded the contract whatever price they offered. Cut this if you are running long.

29

On Rahim Traders' row — rank 1 — press **Award**

SAY “Rahim Traders wins. Sixty-six thousand taka more expensive than the one we rejected, and every step of why is on the file.”

If somebody says “so you paid more”

They are testing you. The answer is short:

“Yes. Sixty-six thousand taka more, for three years of onsite warranty from the manufacturer instead of one year carry-in from a reseller. On twelve machines sitting on your cash counters. The point is not that we paid more — it is that nobody in this building could have engineered that outcome, in either direction.”

The order for twelve, not fifteen

30

Switch user → **Shahidul Islam.** **Purchase orders** → **New work order**

SAY “Rahim won, so now we write them the actual order. A work order. Notice it is already filled in — twelve units, Rahim Traders, at the price they quoted. Nobody retyped anything, so nobody can mistype anything.”

31

Change the quantity from 12 to 15. Press **Issue work order**

SAY “Now suppose somebody in procurement decides to round it up. Fifteen instead of twelve.”

Refused. *Approved quantity: 12. Attempted quantity: 15.*

32

Let them read the refusal, then say it.

SAY “Twelve were approved, back at the very start, because three were already in the store. So twelve is what can be bought. The work order is checked line by line against the original approval. Quantities cannot drift between the approval and the purchase — and that drift is where most procurement loss in the world actually happens.”

Tie it back: **that 12 came from the stock check on the very first screen**, forty minutes ago. Point out that it travelled all the way here on its own.

33

Change it back to 12. Press **Issue work order**

The work order prints on bank letterhead, with the amount written out in words.

Three refusals, and that is the pitch

You cannot approve your own request. You cannot see a price before you have judged the quality. You cannot buy fifteen when twelve were approved.

“You are not buying software that helps your people do their job. You have people who can do their job. You are buying software that will not let the wrong thing happen.”

It arrives, and it gets paid

Move faster now. This part proves the loop closes; it is not where the argument is won.

- 34** On the work order page press **Record receipt**. Enter a challan number, 12 received, 12 accepted. Press **Record receipt**.

SAY “The laptops arrive. The storekeeper counts them. If he had counted ten, the system would carry two as still outstanding and the bill would not match.”

The officer who raised the requisition — Rezaul — is notified automatically. Mention it, do not go and show it.

- 35** **Switch user** → **Nasrin Sultana** → **Invoices** → **Enter invoice**

SAY “Nasrin is in the bills section. The supplier's invoice has arrived.”

- 36** Point at the three-way match panel — three columns side by side, green where they agree.

SAY “The order, the delivery, and the bill. Side by side. If any of those three disagree on the item, the quantity or the price, the bill cannot even be sent for approval. It does not get routed, it gets stopped.”

- 37** Scroll to the money below it.

SAY “VAT, income tax deducted at source, and five percent security money held back through the warranty period. That is clause 1.15 of your own tender document, calculated rather than remembered.”

- 38** Press **Enter invoice and run match**

- 39** If you have time. **Switch user** → **Sumaiya Haque** → **Approve**. Then **Kamrun Nahar** → **Approve**. Then **Golam Mostafa** → **Approve** → **Process payment**

SAY “Nasrin entered it, so Nasrin cannot verify it — the same control you saw at the very beginning, for the third time. Another officer verifies, the finance manager approves, and over ten lakh the CFO approves as well.”

Short on time? Say that chain exists, say who is in it, and move on. Nobody will ask you to prove it.

Prove none of it can be edited

40

Switch user → **Mizanur Rahman** → **Audit trail** . Press
Verify all ... records

SAY “Remember the question about the administrator.”

It goes green in about eleven milliseconds: *All 535 records verified*. Let them watch it run.

41

Click any record open.

SAY “Every action anybody has ever taken. Written in the same transaction as the change itself, so a change without its audit record is not possible — it is not policy, it is that the two cannot come apart.”

It shows the field-by-field change *and* the cryptographic working — the exact bytes, the previous record's fingerprint, and the recomputed one against the stored one.

42

Say the thing about the administrator.

SAY “Each record is locked to the one before it. Change one character anywhere in that history — from inside the database, as an administrator, at three in the morning — and this button turns red and names the first record that fails. No user, no administrator, no vendor of yours, and not us either.”

43

Filter to **REQ/CSD/2026/0847**

SAY “And there is the entire thing we just did together, on one screen.”

Why this answers the envelope question

Somebody in the room was thinking “fine, but our DBA could just open the table.” This is where you close that. Do not wait to be asked twice — if nobody raises it, raise it yourself. It makes you look like you have done this before.

They can change it themselves

44

Workflow builder → open **Requisition Approval v3**

SAY “Last thing. This is the rulebook that decided, forty minutes ago, that Rezaul's request needed two approvals and not three.”

45

In the preview panel on the right, type **3,00,000**

It shows **1 approval**.

46

Change step two's threshold from **500000** to **100000**. Do not save yet.

SAY “Watch the right-hand side.”

The preview redraws instantly — **2 approvals** — and prints the reason: *Value exceeds the 1,00,000 threshold.*

47

Let them see it, then say it.

SAY “No code was written. No change request was raised. Nobody rang us. Your own Common Services administrator does that. When your delegation of authority changes, your system changes the same day — not next quarter, and not for a fee.”

48

Type a reason and press **Save as version 4**

SAY “And it saves as a new version. Anything already sitting in approval keeps the rules it started under. Changing a threshold today cannot reach back and rewrite an approval that began yesterday.”

That last sentence is the first thing a careful IT reviewer asks. Have it ready before they ask it. Saying it unprompted is worth more than answering it well.

Now stop

Do not tour the other modules. Say they are there, offer to open any one of them, and hand the room to questions.

If they want breadth in one click: **About → Module coverage**. All 25 modules, what runs end to end, what is a working register, and what we flagged in the proposal as needing customisation. Being honest on that screen is the reason they will believe the rest.

If something goes wrong

WHAT HAPPENED

WHAT YOU DO

Creating the requisition fails

REQ/CSD/2026/0845 is already sitting in Farhana's queue, raised by Rezaul, identical in every respect. Open that instead. The refusal in Part two works exactly the same on it.

The tender is in the wrong state

`npm run reset` takes about five seconds and is safe to run while the app is running. Refresh the page afterwards.

A screen misbehaves

Every list is reachable from the sidebar and none of them depends on the live thread. Move on, come back to it later, do not debug in front of them.

You lose your place

The five moments are numbered on the pages. Jump to the next one. Nobody in the room knows what you skipped.

If you are running out of time, cut in this order

- The invoice approval chain — Sumaiya, Kamrun, Golam (part eight, last step)
- The vendor portal (part three)
- “Attempt award” on Bengal (part six)
- Reading the comparative statement paragraph aloud (part six)
- Goods receipt (part eight, first step)

Never cut these five

1. Rezaul cannot approve his own requisition · **2.** The price envelope refuses to open · **3.** The order for fifteen is refused against an approval for twelve · **4.** The audit chain verifies and shows its working · **5.** The threshold change redraws the approval route live

What they will ask

“Is this running anywhere live?”

No. This is a working demonstration of the system we proposed. The workflow engine, the permission model, the sealed-envelope control and the audit trail are real code, not screens. It is condensed onto one machine so it is portable. Production is the three-tier architecture in the technical proposal.

“How does it connect to our core banking system?”

Through the middleware tier — one layer owns every external connection, so a change to your CBS API touches one place instead of twenty. Show **Integrations**. Say plainly that no connector on that screen is live yet. Do not oversell this one.

“Can we change things ourselves?”

Workflows, reports, roles and permissions, backup and archival frequency: yes, and you just watched it. Anything structural is a change request. Be precise rather than generous — a promise you cannot keep costs more than a “no”.

“What if a workflow changes halfway through an approval?”

Versions are pinned. The builder tells you how many documents are in flight and that they stay on the old version. Show the note.

“How do we know the audit log has not been edited?”

Press the verify button in front of them, then open a record and show the hash working. Do not explain cryptography. Press the button.

“How long until we have it?”

Ninety working days from work order, as quoted. Phased, with your own user acceptance testing before go-live.

BEFORE YOU WALK IN

You are not demonstrating features. You are demonstrating three things the system refuses to do.

Everybody bidding for this contract can show them a form and a list. Nobody else is going to stand in that room and try to break their own software on purpose, three times, and fail.

Switch the wi-fi off before you start. Let the silences run. When it refuses, stop talking.
